Barossa Valley Wine Region

Incorporating Barossa Zone - other

Regional summary report

2010
ACKNOWLEDGEMENTS

This survey has been produced by the Phylloxera and Grape Industry Board of South Australia on behalf of the South Australian Wine Industry Association, the Wine Grape Council of SA Inc and Primary Industries and Resources SA, who jointly fund the survey.

The publication of this survey is made possible through the support of the South Australian and interstate wineries that processed fruit from South Australian vineyards in 2010. The information is provided voluntarily by wineries on the understanding and assurance that information from individual wineries will be kept strictly confidential. Only aggregate responses are reported. Draft results and supply forecasts are checked by regional industry representatives. Vintage reports have been provided by the regional representatives, local growers or industry associations. Particular thanks for their assistance go to: Jim Caddy, David Edwards, James Freckleton, Juliet Henderson, Elise Heyes, Lian Jaensch, Murray Leake, Frank Nicholls, Louise Rose, Stuart Sharman, Nigel Squire, Michelle Stehbans, David Watkins, and Daniel Zuzolo.

The survey publication is available on the Board’s website www.phylloxera.com.au. The state summary and regional reports can be downloaded as PDF files. Previous reports (since 2000) are also available on the website, and hard copies of reports from previous years back to 1998 are available from the Board’s office.

Explanations and Definitions

INTAKE (CURRENT VINTAGE) DATA

Definition of regions
Regions have been defined in accordance with Geographical Indication (GI) boundaries. If a GI region has not been declared, or produces less than 5,000 tonnes, then the data is aggregated into the relevant GI zone. Disaggregation of data into smaller regions such as Southern Fleurieu and Mount Benson is available on request from the Board’s office.

Total crush
The total crushed is the total tonnes of grapes crushed from a particular source region, whether processed in that region, another region in SA or interstate. All wineries in Australia that are known to source fruit from South Australian vineyards are included in the survey collection process. However, not all wineries submit a survey form - therefore the total tonnage reported may underestimate the true crush. An estimate of the non-response rate for each intake summary report. Reported fruit is separated into fruit produced from the winery’s own or associated vineyards (“own grown”) and from independent vineyards (“purchased”).

Crop value data
On the survey forms, wineries are asked to record total purchase value. This is the total amount paid for fruit of a particular variety at the point of receipt – NOT including freight. It includes any penalties or bonuses (e.g. Baumé) applied at the weighbridge, but DOES NOT INCLUDE other bonuses or adjustments such as end use quality bonuses, which are not available at the time the survey is conducted.

The calculated average purchase value per tonne is the average amount paid per tonne of fruit across all wineries. Winery grown grapes are not included in the calculation of average purchase value; nor are grapes grown by companies connected with the winery or under lease arrangements. The estimated total value of purchased grapes is calculated by multiplying the average purchase value per tonne by the total tonnes purchased. The estimated total value of total grapes is calculated by multiplying the average purchase value per tonne by all tonnes crushed. If there is a variety where there are no purchases, then the average purchase value across all other varieties of the same colour in the same region is used to determine an estimated value for the own grown grapes.

Note: in small varieties there may sometimes be only one winery contributing towards a calculated average purchase value per tonne.

Important note on average purchase value
There is considerable variation in the pricing arrangements made by different wineries. For example, some wineries make adjustment payments based on the average value per tonne reported in this survey and some pay quality bonuses based on the end use of the product. These additional payments are not included in the reported figures. The average price also does not give any indication of the distribution of prices, or variables that go into individual contracts. Therefore the average price should not be compared directly with an individual grower’s arrangement.

Highest and lowest price
Winery are asked to report the highest and lowest prices paid for any parcel of fruit of a particular variety, of any size. The highest of all highest prices, and the lowest of all lowest prices are reported – provided that at least three wineries have provided this information for any particular variety. Note: the highest or lowest price may be for a very small parcel of fruit - and/or reflect an unusual pricing arrangement - eg payment by the hectare rather than per tonne, “spot market” sales of excess fruit etc.

FORECASTS

Estimated supply
Supply forecasts have been calculated independently using the planting information obtained from the PGIBSA vineyard register (see below). They are calculated by multiplying the area of vines by an estimated yield figure determined separately for each variety in each region, which takes into account industry practices and objectives as well as historical averages. However, the supply forecasts do not make any allowance for future vine removals or mothballing, yield capping or the effects of ongoing water restrictions or unusual seasonal conditions.

Committed intake
Committed intake is the amount of fruit that wineries are already committed to take in, for a given future year. It is made up of winery grown fruit and contract purchases. Only existing or ongoing contracts are included – not intended future signings or renewals.
Explanations and Definitions

Available supply
Available supply (uncommitted fruit) is the difference between estimated supply and committed intake. It is the amount of fruit estimated to be available on the open (spot) market. NB If the committed intake is higher than the estimated supply, this indicates a discrepancy between the independent supply forecasts and the wineries’ estimates of future production. In this case, available supply is recorded as zero – rather than as a negative number.

Comparing supply and committed intake
In order to compare supply with committed intake, the latter figures are “raised” to compensate for non-respondents. There is no raising of supply figures because it is assumed that the PGIBSA vineyard planting information is close to 100% complete. The non-response rate is calculated separately for each region and is indicated below the relevant tables.

Demand (required intake)
Following consultation with industry during 2009, it was decided to omit demand figures from the 2010 survey. These figures were considered by the majority of respondents to be unreliable and/or unhelpful. They also add considerably to the survey load for the wineries. Readers of this report are encouraged to provide feedback on this decision either directly to SAWIA or the WGCSA, or to the PGIBSA.

PLANTING DATA

Derivation of planting data tables
Planting data is not derived from the 2010 South Australian Utilisation and Pricing Survey of wineries. The information is obtained from the vineyard register maintained by the Phylloxera and Grape Industry Board of South Australia.

The Board is required under the Phylloxera and Grape Industry Act 1995 to maintain a complete and accurate register of grapegrowers in the state. All vineyard owners with more than 0.5 hectares are required by law to register with the Board, and to complete an accurate vineyard return each year, giving details of their plantings. This information is kept strictly confidential. An accurate vineyard register enables the Board to produce complete, up-to-date statistical information on vineyard plantings by variety, year planted and location.

For more information on registration of vineyards, please contact the Phylloxera and Grape Industry Board office on 08 8362 0488.

Explanatory notes for planting data tables

1. Planting data tables are current as at April 2010 and include all plantings from the 2009 planting season. Vines planted in a particular year may include topworked or replaced vines, as well as new plantings in virgin ground. Where vines have been replaced or topworked, the old variety record is removed. This explains why the area planted for earlier years may be different in the 2010 report compared with previous reports.

2. Vineyard plantings are recorded by Geographical Indication. Planting details for smaller regions not included in the survey report are available on request from the Board.

3. Where a 0 appears in a table, this may indicate the presence of a planting of less than 0.5 hectares, or it may indicate zero plantings. Rounding may produce a slight error in totals or percentages.
Barossa Valley Vintage overview

**Vintage report**

The Barossa experienced its best rainfall in five years during winter and spring of 2009, providing good soil moisture for the onset of the growing season in Barossa Valley floor vineyards. Late spring was fairly mild with some moderately warm days resulting in an early budburst. The initial growth was very slow across the region and as the cool wet weather set in with daily maximum temperatures barely 20°C it caused vines to appear anaemic and stunted. Isolated wind and hail also damaged many of these weaker early shoots.

A nine-day heatwave peaking at 41.5°C and windy weather in early November coincided with flowering for many earlier blocks in the Barossa Valley; causing rapid leaf and canopy growth but in some varieties it caused shatter and low fruit set. Chardonnay and Grenache were the worst affected varieties during this period.

Warm and mild weather ensued for the remainder of the growing season so canopies were very healthy and ripening accelerated for an early vintage. The onset of cool nights in mid-March slowed the final harvest for some later varieties and vineyards.

There was minimal disease throughout the Barossa Valley, with only isolated incidences of powdery mildew.

Chardonnay and Grenache crops were generally very poor this year due to the hot and unfavourable flowering conditions. Shiraz however was much more resilient and produced reasonable yields. Quality was excellent, particularly for Cabernet Sauvignon, while the low yielding Grenache and older vine Shiraz was very even showing excellent colour and flavour development.

Whilst classification tastings are currently underway, the resultant wine is showing that this has been an exceptional year for the Barossa. Shiraz – the stalwart, Grenache, Mataro (Mourvèdre) and Cabernet Sauvignon are all strong with dense colours, personality and true variety expression.

Semillon could be showing the best and purest varietal expression for some years.

**Overview of vintage statistics**

The harvest from the Barossa Valley (including Barossa zone – other) was 60,796 tonnes in 2010, 9,000 tonnes more than the 2009 harvest and the fifth highest crush recorded for this region. The total value of grapes from the region was just over $67 million, and average purchase values in all the major varieties decreased for the second year in a row. The decreases experienced this year were not as high as for 2009, although Shiraz fell a further $180 per tonne and Chardonnay a further $100 per tonne to a new record low.

New plantings in the Barossa Valley in spring 2009 (including top-working and replacements) were 128 hectares – with 50% Shiraz and 13% Tempranillo. This is 1% of the total area, half of last year and in-line with the state average of 1% new planting.

The estimated production from the Barossa Valley for 2011 is around 72,000 tonnes – assuming a return to full potential. The wineries’ committed intake is 63,000 tonnes, leaving only 9,000 tonnes or 12% uncontracted.

In 2015, the estimated production is expected to be similar at 73,000 tonnes, of which 68% (50,000 tonnes) is already under contract or winery grown fruit. This leaves an estimated 23,000 tonnes to be sold on the open market or signed up in the intervening period.

Across the state, assuming "normal" growing conditions, there is expected to be a 278,000 tonne surplus compared with demand in 2015 (see State Summary section).
