

RESPECT THE
VINES THAT
PRODUCE OUR
WINES

WELCOME VISITORS
TO SOUTH AUSTRALIA:
THE WINE CAPITAL

Thousands of people visit our South
Australian wine regions to enjoy
some of the world's finest wines

KEEP SOUTH AUSTRALIA PHYLLOXERA FREE

WHAT IS PHYLLOXERA?

Phylloxera is a small, yellow insect that resembles a rose aphid (but much smaller). It only lives on the roots of vines and is present in infested vineyards in Victoria and NSW. It can cause the vines to decline and die.

Phylloxera crawlers

YOU CAN HELP US

Phylloxera can be carried in soil, grapes, leaves or anything (including cars and bicycles) that picks up any of these. People can also carry the insect on their footwear or clothing.

Please remember:

- Respect signage around the vineyard
- Do not walk or drive amongst the vines
- Adhere to pathways and driveways

Vine dying due to phylloxera damage

Phylloxera has no impact on the flavour or quality of the grapes or wine.
